

Activity 6 - Part 1

Instructions:

1. **Install and Set Up Redux Toolkit**
 - o Continue from your Activity 5 React API app.
 - o Install @reduxjs/toolkit and react-redux.
 - o Create store.js and wrap the app with the Redux Provider.
2. **Create Redux Slices**
 - o Create usersSlice.js and postsSlice.js.
 - o Each slice should manage data, loading, error, and selected item or search state if needed.
3. **Move API Logic into Async Thunks**
 - o Use createAsyncThunk to fetch users, posts, and a single post by ID.
 - o Keep fetch() for users and axios for posts.
 - o Handle pending, fulfilled, and rejected states inside extraReducers.
4. **Connect Pages to the Redux Store**
 - o Replace local API state with useSelector values.
 - o Use useDispatch inside useEffect when pages load or route params change.

Activity 6 - Part 2

1. Refactor the Existing React Router Pages

- o Keep the routes from Activity 5: Home, Users, Posts, Post Details, and About.
- o Do not remove React Router; Redux should manage shared app state, not page navigation.
- o Keep the Navbar visible across all routes.

2. Use Redux State for UI Feedback

- o Read loading and error values from the Redux slices.
- o Display loading messages while the API request is running.
- o Display friendly error and empty-state messages when needed.

3. Keep Tailwind CSS Styling

- o Keep the Tailwind card layout, spacing, colors, and typography from Activity 5.
- o Make sure the Users, Posts, and Post Details pages are still responsive.
- o Add hover effects or active states where they improve the user experience.

4. Organize and Verify the Refactor

- o Suggested folders: app/store.js, features/users/usersSlice.js, and features/posts/postsSlice.js.
- o Remove unused local state and old API logic from the pages.
- o Use Redux DevTools to confirm pending, fulfilled, and rejected actions are working.
