

Activity 7 - Part 1

Instructions:

1. **Install Vitest and React Testing Tools**
 - o Continue from your Activity 6 Redux refactor project.
 - o Install vitest, Testing Library, jest-dom, user-event, and jsdom, then add a test script in package.json.
2. **Configure Vitest for React**
 - o Set the jsdom environment and setupFiles in vite.config.js.
 - o Create setupTests.js and test files using .test.jsx or a __tests__ folder.
3. **Write Component and UI Tests**
 - o Test that the Navbar renders the Home, Users, Posts, and About links.
 - o Test loading, error, empty states, and user or post cards using sample data.
4. **Test React Router and Redux Integration**
 - o Render pages with MemoryRouter and Redux Provider when needed.
 - o Test clicks, then test Post Details route (/posts/:id) using screen, render, waitFor, and userEvent.

Activity 7 - Part 2

1. Run and Verify the Tests

- o Run the test command and make sure all tests pass.
- o Fix failing tests before continuing to deployment.
- o Make sure the app still works normally after adding the test setup.

2. Prepare the App for Deployment

- o Run npm run build and confirm that the production build is successful.
- o Run a local preview of the build and check the main pages.
- o Add a Netlify redirect setup so React Router routes work after refresh.

3. Deploy the React App to Netlify

- o Push the latest working code to the GitHub repository.
- o Connect the repository to Netlify and use npm run build as the build command and dist as the publish folder.
- o Verify the deployed Home, Users, Posts, Post Details, and About pages.

4. Update the README File

- o Add the deployed Netlify link to the README.md file in the repository.
- o Include basic instructions for installing dependencies, running the app, running tests, and building the project.
- o Keep the README clear so another developer can understand and run the project.
